Canterbury Computer Science education research group

Tim Bell, 4 Feb 2011

This is a brief summary of the activities of the University of Canterbury Computer Science education research group. The group is led by Tim Bell, with involvement from Mick Grimley (College of Education). Currently there are about 8 students doing research associated with the group; they are also involved in departmental outreach as well as education research and teaching.

Computer Science Unplugged

Overview: The CS Unplugged project is at the core of the CS Education group’s work. CS Unplugged (csunplugged.org) provides a variety of resources that engage students in Computer Science activities without using a computer, instead interacting with ideas from Computer Science through magic tricks, games and puzzles [Bell 2009]. These activities generally have a strong kinaesthetic component and take a constructivist approach: students are given enough clues to enable them to work out principles for themselves. A constructivist approach is important for outreach because it demonstrates to the students that much of the knowledge is something they could have invented themselves; and of course, it is a lot more engaging that simply being told some impressive facts.

The CS Unplugged resources are available for free download; as well as activities with specific guides for the presenter, there are videos demonstrating the activities or providing challenges to students, and links to extensive related material for follow-up. Another format for the material is a one-hour show [Bell 2000], designed for a broad coverage of CS topics in a short time, rather than in-depth work by the students.

CS Unplugged is used in many situations around the world, generally relating to one-off events and visits, but increasingly as components of teaching programmes [Choi et al 2008, Bell et al. 2010]. It started
around 1992 as a collection of ideas for outreach from universities to K-12
schools, but through its inclusion in the ACM K-12 curriculum in 2003 it started
to be seen as the basis of a new approach for teaching CS in schools, either as the
main material, or a supplement that gives students a break from being in a
computer lab. It has been sponsored by Google since about 2006.

**Translations:** The CS Unplugged books have been translated into about 14
languages, and the videos have translated soundtracks and/or subtitles [Bell et
al. 2008]. This is largely volunteer work from interested people in other countries,
although the Chinese version that has just been released was a major re-write,
designed for local culture, and for use by students rather than as a guide for teachers.

Currently YingChun Han from Kunming Metallurgical College is visiting for 12
months (until April 2011), and is working on a paper about how Unplugged and related
styles of teaching fit in to Chinese educational culture. Tim visits China for
about a month each year, and uses this time to work with local contacts about CS
education in that culture.

**Virtual worlds**

Peter Thompson (PhD student) is developing CS Unplugged activities in Second Life and Greenfoot,
and evaluating their effectiveness for automated gathering of data for educational research
[Thompson and Bell 2010]

Previously we have worked on providing CSUnplugged activities in virtual worlds for students
with special needs [Bell et al. 2009, Marghitu et al. 2009]

**NCEA resource development and evaluation**

Starting in 2011, NCEA will include standards that teach
Computer Science [Bell, Andreae and Lambert 2010]. Sumant Murugesh (research assistant) is developing a guide to
resources for teaching Computer Science for new NCEA
achievement standards [Murugesh, Bell and McGrath 2010],
funded by a MoE contract and with support from NZ CS
departments. The material is available at
Brett Ward (honours student) has worked on using Alice and Scratch to do “real” computer science [Bell et al. 2010], and Linda Pettigrew (summer scholar) has implemented several pairs of algorithms in Scratch so students can compare their speeds (e.g. quicksort vs. selection sort) without having to implement them. This supports the algorithms part of AS 1.44. This is to be developed into a larger range of resources to support students exploring the complexity of algorithms without having to implement them.

Samuel Williams (honours student): as a course project, developed posters comparing programming languages, as a starting point for students doing the languages part of AS 1.44.

COSC433 is a 400-level course where students learn about CS education, and develop resources, mainly aimed at the new NCEA standards. The paper was first taught in 2010 with Lynn Lambert [Bell and Lambert 2011]

CS Field Guide
Tim Bell is working with Peter Denning and Rick Snodgrass, who have an NSF grant to develop an extra-curricular system where students can work on Computer Science topics, akin to the Boy Scouts badge system, where there are levels to work through, and mentoring and general activities that support the specific goals.

Steve Dunford (summer scholar) is developing a report on badge systems (e.g. Scouts, St Johns, Martial arts) and how to adapt them to a CS based structure.

Non-programming outreach activities
Tim is working with people from the UK (Paul Curzon, Quintin Cutts), Israel (Bruria Haberman) and Lithuania (Valentina Dagiene) on a paper to compare and contrast various approaches to outreach: CS Unplugged, CS4FN, Bebras, CS Inside etc. They all share resources, but have different ways of delivering the material. All are “successful” in that they have had tens or hundreds of thousands of students using them. We are interested in identifying the key elements that make them successful.

Repositories of Learning objects
Working with developers of sites with teaching resources to find a way to make the range of material easy to navigate, and to make sensible re-use of the resources for different contexts [Curzon et al. 2009].

Other work
Over the years we’ve published various papers about novel approaches to teaching Computer Science at university, including digital recordings of lectures [Bell et al. 2001], podcasts [Bell et al. 2007], and a novel way to relate sorting algorithms [Bell and Aspvall 2011].

Future work

- Develop a student version of the CS Unplugged material, aimed at supporting the emerging curricula (including NCEA, AP, and UK curriculum) [Bell et al. 2010]
- Develop new materials for NCEA
- Evaluate the effectiveness of the new NCEA CS curriculum, including effect on teachers, student attitudes, and student achievement.
- Integrate CS Unplugged activities with programming (Scratch, Alice, Greenfoot, Kodu) and Robotics
- Investigating Computational Thinking and CS Unplugged [NRC 2010]
- Story-telling approaches to teaching about Computer Science [Bianco, Bell and Tinazzi 2009]; see also our recent video “Santa’s Dirty Socks”
- Establishing how best to design new educational experiences based on the “Unplugged” idea [Nishida et al. 2009]
- Using Unplugged in the context of Science Fair projects and programming competitions [Voigt 2009]
